CS23336-Introduction to Python Programming

Started on Saturday, 19 October 2024, 8:38 PM

State Finished

Completed on Saturday, 19 October 2024, 10:52 PM

Time taken 2 hours 14 mins **Marks** 10.00/10.00

Grade 100.00 out of 100.00

Question 1

```
Correct
Mark 1.00 out of 1.00

Flag question
```

Question text

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to K.

Examples:

```
Input: t = (5, 6, 5, 7, 7, 8), K = 13

Output: 2

Explanation:

Pairs with sum K(=13) are \{(5, 8), (6, 7), (6, 7)\}.

Therefore, distinct pairs with sum K(=13) are \{(5, 8), (6, 7)\}.

Therefore, the required output is 2.
```

For example:

1,2,1,2,5 1

```
Input Result
```

```
1,2
Answer:(penalty regime: 0 %)
def fun(t,k):
  s=set()
   p = set()
   for n in t:
     c=k-n
     if c in s:
p.add(tuple(sorted((n,
c))))
     s.add(n)
   return len(p)
t=tuple(map(int,input(
).split(',')))
k=int(input())
print(fun(t,k))
```

Feedback

Input Expected Got

5,6,5,7,7,8 13 2 2 1,2,1,2,5 3 1 1

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 2

Correct
Mark 1.00 out of 1.00

Flag question

Question text

You are given an integer tuple nums containing distinct numbers. Your task is to perform a sequence of operations on this tuple until it becomes empty. The operations are defined as follows:

- 1. If the first element of the tuple has the smallest value in the entire tuple, remove it.
- 2. Otherwise, move the first element to the end of the tuple.

You need to return an integer denoting the number of operations required to make the tuple empty.

Constraints

Input: nums = (3, 4, -1)

- The input tuple nums contains distinct integers.
- The operations must be performed using tuples and sets to maintain immutability and efficiency.
- Your function should accept the tuple nums as input and return the total number of operations as an integer.

Example:

```
Output: 5

Explanation:
Operation 1: [3, 4, -1] \rightarrow First element is not the smallest, move to the end \rightarrow [4, -1, 3]
Operation 2: [4, -1, 3] \rightarrow First element is not the smallest, move to the end \rightarrow [-1, 3, 4]
Operation 3: [-1, 3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4]
Operation 4: [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [4]
Operation 5: [4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [3, 4] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest, remove it \rightarrow [4, -1, 3] \rightarrow First element is the smallest eleme
```

For example:

Test Result
print(count_operations((3, 4, -1))) 5

Answer:(penalty regime: 0 %)

Reset answer

```
def
count_operations(num
s: tuple) -> int:
    # Your
implementation here
    op=0
    nums=list(nums)
    while nums:
    if
nums[0]==min(nums)
:
        nums.pop(0)
    else:
nums.append(nums.p
op(0))
    op+=1
    return op
```

Test	Expected	l Got
<pre>print(count_operations((3, 4, -1)))</pre>	5	5
<pre>print(count_operations((1, 2, 3, 4, 5)))</pre>	5	5
<pre>print(count_operations((5, 4, 3, 2, 1)))</pre>	15	15
<pre>print(count_operations((42,)))</pre>	1	1
<pre>print(count_operations((-2, 3, -5, 4, 1)))</pre>	11	11

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 3

Correct
Mark 1.00 out of 1.00

Flag question

Question text

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

For example:

Input Result

hello world

1

```
Answer:(penalty regime: 0 %)
def
function(a:str,b:str)-
>int:
  a=a.lower()
  b=b.lower()
   w=a.split()
  b1=set(b)
  count=0
  for i in w:
     if not set(i)&b1:
        count+=1
   return count
a=input()
b=input()
print(function(a,b))
```

Marks for this submission: 1.00/1.00.

Question 4

Correct
Mark 1.00 out of 1.00

Flag question

Question text

Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively.

The next two lines contain the space-separated integer arrays to be compared.

Sample Input:

5 4

12865

26810

Sample Output:

1510

```
3
```

Sample Input:

5 5

12345

12345

 $\underline{\textbf{Sample}} \ \textbf{Output:}$

NO SUCH ELEMENTS

For example:

```
Input
              Result
\begin{smallmatrix}5&4\\1&2&8&6&5\\2&6&8&10\end{smallmatrix}
5 5
1 2 3 4 5 NO SUCH ELEMENTS
1 2 3 4 5
Answer:(penalty regime: 0 %)
s1,s2=map(int,input().
split())
a1=list(map(int,input(
).split()))
a2=list(map(int,input(
).split()))
c=set(a1+a2)
ce=set(a1)&set(a2)
n=sorted(c-ce)
if n:

Mark 1.00 out of 1.00

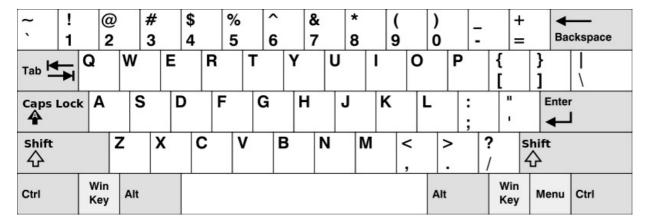

Flag question

Question text

Given an array of strings words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

In the American keyboard:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

Example 1:

```
Input: words = ["Hello","Alaska","Dad","Peace"]
Output: ["Alaska","Dad"]
```

Example 2:

```
Input: words = ["omk"]
Output: []
```

Example 3:

```
Input: words = ["adsdf","sfd"]
Output: ["adsdf","sfd"]
```

For example:

Input Result

```
4
Hello Alaska
Dad Dad
Peace

2
adsfd afd
```

Answer:(penalty regime: 0 %)

```
def
function(word,rows):
  l=word.lower()
  for row in rows:
    if all(char in
row for char in I):
       return True
  return False
def find(words):
  rows=
["qwertyuiop","asdfg
hjkl","zxcvbnm"]
  res=[]
  for word in words:
    if
function(word,rows):
res.append(word)
```

Input Expected Got

4
Hello
Alaska
Dad
Peace

Question text

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

For example:

Input Result

01010101010 Yes

```
010101 10101 No
```

```
Answer:(penalty regime: 0 %)

def bin1(s):
    s=set(s)
    if
s.issubset({'0','1'}):
        return 'Yes'
    else:
        return 'No'
print(bin1(input()))
```

Input Expected Got

01010101010 Yes Yes

REC123 No No
010101 10101 No No

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 7

Correct
Mark 1.00 out of 1.00

Flag question

Question text

The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

• For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

Example 1:

Input: s = "AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT"
Output: ["AAAAACCCCC","CCCCCAAAAA"]

Example 2:

Input: s = "AAAAAAAAAAA"
Output: ["AAAAAAAAAA"]

For example:

```
AAAAACCCCCAAAAAGGGTTT AAAAACCCCC
Answer:(penalty regime: 0 %)
def dna(s):
  seq={}
  res=[]
  for i in
range(len(s)-9):
     s1=s[i:i+10]
     if s1 in seq:
        seq[s1]+=1
     else:
        seq[s1]=1
  for s1,c in
seq.items():
     if c>1:
res.append(s1)
  return res
res1=dna(input())
for s1 in res1:
